SecureSphere Operations Manager

Simplify management for large, multi-domain environments

SecureSphere Operations Manager (SOM) is a multi-domain management solution that dramatically improves the operational efficiency of managing SecureSphere deployments with multiple MX Management Servers. SOM meets the operational scalability demands of large enterprises and Managed Security Service Providers by consolidating management, visibility and reporting across multiple SecureSphere MX Management Servers, and providing system wide health metrics and statistics.

Manage multi-domain and multi-tenant environments

SOM easily manages large numbers of SecureSphere MX Management Servers in deployments spanning different datacenters, geographies, business units or customers. As a manager of managers, SOM provides a single, overall point of control and visibility across the entire deployment.

Manage and distribute policies system wide

Create, configure and apply security and audit policies from one management console to all MX Management Servers. A common set of policies can be applied across multiple-domains, ensuring security and auditing is consistent across the environment. Federated management of auditing and security policies, and the ability to monitor this behavior enterprise wide, makes SOM a necessary component for deployments with multiple MX Management Servers.

Access each MX Management Server from one location

In addition to aggregating information into a single user interface, the SOM dashboard and charts enable quick drill-down access to individual MX Management Servers to perform policy configurations and detailed analysis. This saves time by simplifying and accelerating access to relevant management resources.

Monitor environment health

SOM provides a dashboard view of health for the entire deployment. It delivers visibility into system wide performance and problem areas by aggregating performance and status metrics for individual MX Management Servers, Gateways and Agents.

View overall security activity

SecureSphere summarizes security alert volume and types to provide an overall view of security status. Administrators can quickly detect areas requiring further investigation or troubleshooting and drill down into alerts to view details without having to log in to individual MX Management Servers.

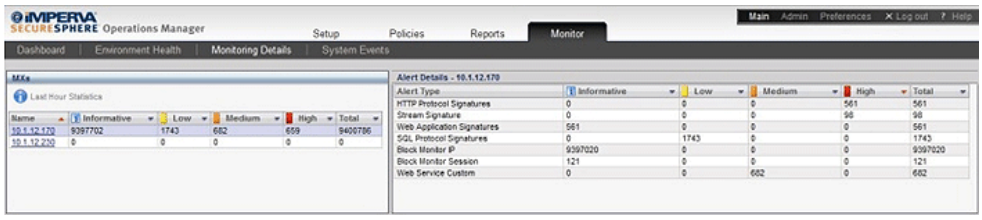
SecureSphere Operations Manager Benefits

- Streamline administration of large distributed environments
- Simplify system wide analysis and reporting
- Increase operational efficiency and lower costs
- Accelerate access to relevant resources
- Uncover security risks or compliance gaps

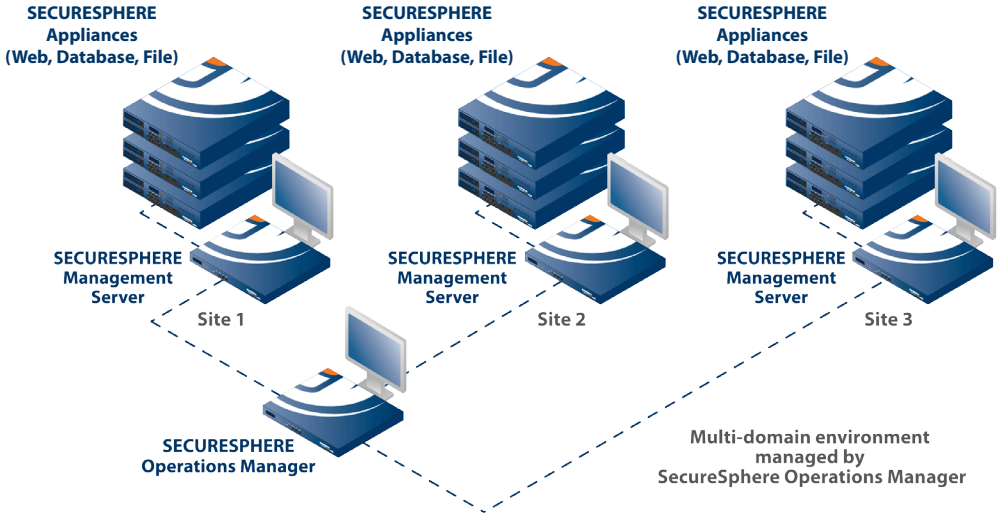
System wide visibility and management controls

SecureSphere Operations Manager simplifies administration of distributed SecureSphere deployments with its graphical dashboard, interactive analytics and ability to drill down into individual MX Management servers.

View system health and alert volume from the SOM Dashboard



System wide security alert summary



SecureSphere Operations Manager

Centralized visibility of system health, appliance status, and security metrics streamlines the process of managing multiple datacenters, geographic locations, business units and customers.
