

Imperva Project Discovery and Analysis Service

DATA SHEET

Highlights

- Confidence in the project's goal and benefit realization
- Formalizing business and technical requirements
- Buy-in from stakeholders within your organization
- Assessing project risks and issues for mitigation
- Architectural view of solution

Service Details

The discovery and analysis is the foundation for success and forms the bridge between the business and the technology implementation. The Imperva project discovery and analysis service (pDnA) is the first step in building a comprehensive data control and protection solution. pDnA service will facilitate the definition of an IT security project and focus on the overall solution benefits, scope, risk, quality, budgets and timescales. We will run workshops to gather information from stakeholders and build an accurate and comprehensive set of requirements and outcomes that are agreed upon and documented.

Loss, manipulation or theft of critical data has far-reaching consequences for any organization including:

- Brand damage and declining customer confidence
- Risk of regulatory non-compliance and heavy fines

Imperva Methodology

Our eight stage project methodology is flexible, modular and can adapt to an organization's project and operational governance, process, and policies.

- Discover
 - Workshop and project template
- Analyze
 - Business requirements, solution blueprint and project brief
- Report
 - Business requirements, solution report and presentation

A more effective security team has a greater likelihood of intercepting and addressing security events and threats in their early stages before they can significantly impact the enterprise.

Our team and partnerships consist of highly qualified consultants, architects and project managers who are CISSP®, ITIL®, PRINCE2®, GDPR certified and aware of compliance and regulatory governance. We will help you define and deliver your information security solutions.

Deliverables

The service will deliver an overall assets register and control recommendations covering:

- Build solution credibility
- Identifies customer key objectives, requirements and critical success factors
- Defines the overall approach and delivery strategy
- Delivers high level solution design
- Identifies the project's key stakeholders and creates a project team
- Understand use cases and data application protection business strategy

Why Is Discovery and Analysis So Important?

IT security projects fail to deliver business benefits for a variety of reasons, such as business case driven by price rather than value, ineffective stakeholder management and lack of alignment across design, build and operate.

The pDnA deliverables will ensure the project's goals and the business impact are clearly defined and aligned with your corporate vision and are in line with senior management expectations.
