imperva

Paying too much to protect your network?

Switch to Imperva

Fast, Effective and Automated DDoS Protection to mitigate the most damaging DDoS attacks

Reduce Costs

Imperva DDoS Protection for Networks is extremely easy to deploy and customize to your application. Imperva has a large professional services organization that can be an extension of your IT or security team without going over budget.

Minimize downtime

Every second of downtime equates to losing revenue. When it comes to choosing DDoS protection for your network, fast, effective and reliable mitigation with minimal disruption to business.

Every second counts when under attack

Imperva has a Service Level Agreement (SLA) of 3 seconds meaning DDoS mitigation will start in 3 seconds or less once the first packet hits. And this applies no matter the size or for how long you're under attack.

Global DDoS Mitigation Capabilities

Every one of our Points of Presence (PoPs) offers comprehensive DDoS mitigation capabilities, as opposed to other providers who may redirect traffic to distant locations, adding latency to traffic whenever there is a DDoS attack.

Full-Stack Security Options for Resilience

Designed with a single stack of layered security services at every PoP, traffic can flow through a DDoS scrubbing center at any location and with fully-automated, SDN and resilient architecture, it can mitigate the largest attacks.

"We're paying a small price to avoid lost business and bad customer experiences."

Aaron Blakely
