Control Peak Traffic and Access to Your Website with a Virtual Waiting Room
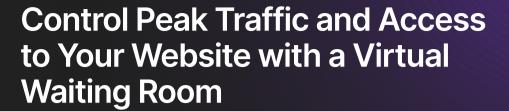

Website traffic volume can increase substantially during peak periods. As much as organizations plan ahead, it is hard to predict exactly how much the traffic will increase.

Managing the flow of traffic securely is essential to industries and services that deal with sensitive information.

Healthcare

- Setting up virtual appointments
- Managing prescriptions and insurance information

Finance

- Investing or trading
- Checking online bank statements
- Meeting virtually with a financial advisor

Government

- Filing taxes
- Applying for a passport
- Registering to vote

Imperva Waiting Room puts organizations in control of the flow of traffic safely and securely by redirecting legitimate visitors who exceed a set threshold into a virtual holding space during peak hours, where they are given an estimated wait time until it is their turn to access your website. This means a more seamless experience for users, increases the likelihood of their return, and ensures that your website is able to handle all incoming visitors.
